

Financial markets have become reliant on communication using the FIX (Financial Information eXchange) protocol. FIX messaging has led to the appearance of a number of networks and vendor systems. A suitable service allows you to connect with entities that already use it. By using this standardised connectivity, the need to rely on customised solutions is minimised.

Straight-forward FIX server

FixWay® is a FIX messaging standard server. With this stand-alone application, you can integrate the delivery of messages, increasing the efficiency of banking transactions, which are executed with the highest quality. It offers support for all FIX versions. FixWay also has the ability to integrate more than two applications, significantly simplifying business workflows. We have a deep insight into the FIX world that we have applied in the development of our solution and that our implementation experts show in every project.

Enable your connectivity with distribution and trading platforms

Coping with the current trading volumes and emerging venues is a significant challenge. Enhance your trading capacity by enabling trading applications while avoiding connectivity latency and using software that is robust enough. Integration with your architecture is fast and easy due to the availability of a wide range of adapters. FixWay offers full comprehensive support, even for the latest versions of FIX. Different integration layers can be added for new applications which you wish to link, simplifying counterparty connectivity.

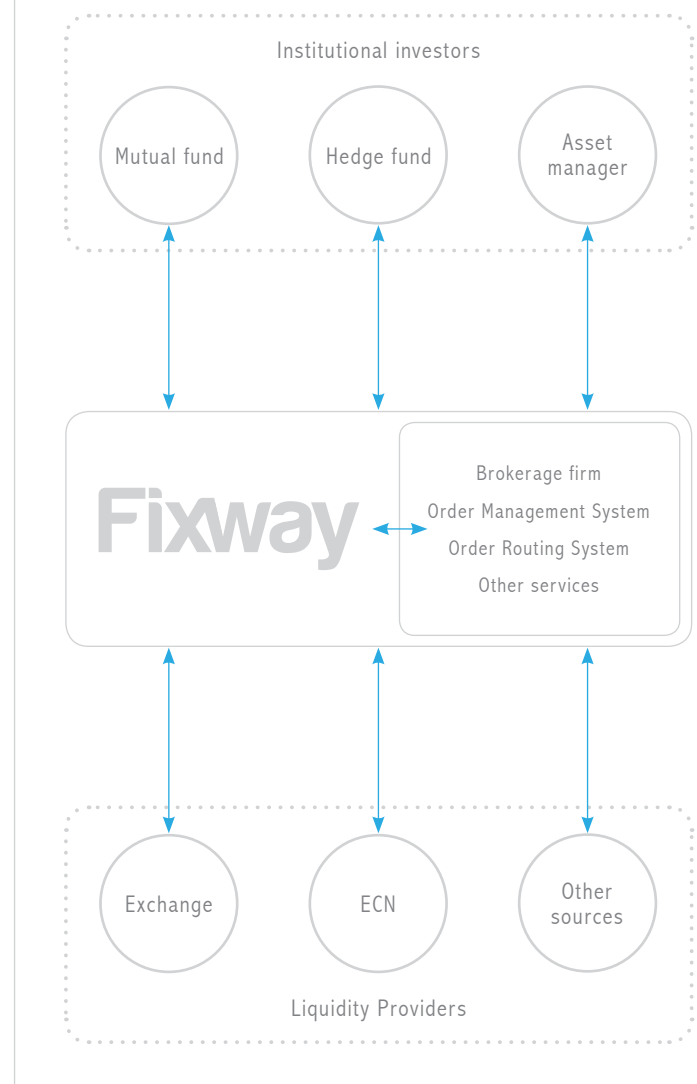

Comprehensive online monitoring through visual summaries

Monitor your messages and sessions at a glance through dashboard-style graphs:

The broker model

Features

- Customisable
- Scalable architecture: just add an integration layer to extend your network with another application
- Ability to monitor open sessions
- Consistent low latency

Benefits

- New investment opportunities are open by enabling access to distribution platforms
- Low-cost solution that offers the reliability of QuickFix, a standard and popular engine
- Operational risk is reduced by improving the quality of transaction execution and avoiding lost messages
